Float & Thermostatic Trap Repair Kits for All Common F&T's

APPLICATION

MEPCO F&T Repair Kits give the end user the ability to completely renew their existing F&T Traps without costly re-piping typically associated with steam trap replacement. These Float and Thermostatic Traps are found on steam heating systems and process applications where discharge of large quantities of air is required for start -up and then immediate purging of condensate as it is generated.

Features and Benefits

- 1.) Simple rugged construction. Where applicable the MEPCO repair kit includes a complete factory assembled and tested head assembly (trap less body). The cast iron head and corrosion resistant valve parts insure longevity.
- 2.) All kits include a sensitive thermostatic element that has been calibrated under high vacuum and steam to discharge air on start up and close tightly to prevent any live steam loss.
- 3.) There is an instant discharge of condensate when it is present. The float operated and water sealed valve mechanism provides immediate discharge as condensate forms with no sub-cooling required.
- 4.) All kits are designed to duplicate the original manufactures specifications and meet Federal Spec WWT-696.
- 5.) Manufactured in the U.S.A.

Materials

Part	Description
Head	Cast Iron ASTM-A278
Seat	Stainless Steel/Brass
Plug	Stainless Steel
Float	Stainless Steel
Gasket	Non Asbestos
